***Election/Restrictions***

1. Applicant's election without traverse of Claims 1-9, 27-34 and 61-69 in the reply filed on 03/17/08. Therefore, non-elected claims 10-26, 35-60, 70, and 101 would be canceled.

**EXAMINER'S AMENDMENT**

2. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended to meet a condition for allowance as follows:

Cancel claims 10-26, 35-60, 70, and 101.

***Allowable Subject Matter***

3. Claims 1-9, 27-34, 61-69, 102-107 are allowed.  
Claims 1, 27, 61 and 102 are independent claims.

The following is an examiner's statement of reasons for allowance:

**As to claims 1 and 61**, the present invention from the current application discloses a method and program for "determining whether the display list object includes a math or logic function requiring a hard processing operation; rendering, in a device specific page in memory, the to-be-printed object by selecting at least one of a plurality of algorithms based upon the determination; and printing the to-be-printed page using the device specific page.

**As to claim 27**, the present invention from the current application discloses a method for “determining whether the band display list includes a math or logic function requiring a hard processing operation; and rendering the bands into a device specific page in memory for printing, a band containing the to-be-printed object being rendered differently from a band not containing the to-be-printed object dependent upon the determination.

**As to claim 102**, the present invention from the current application discloses a method for “determining whether the math or logic function for the to-be-printed object or the band display lists requires a Boolean or algebraic processing operation having two or more inputs; and rendering the to-be-printed object in a device specific page in memory on a band-by-band basis, a band containing the to-be-printed object being rendered differently than a band not containing the to-be-printed object based upon the determination; and printing the to-be-printed page using the device specific page.

However, the closest prior art such as Gauthier et al. (US Patent No. 7,532,355 B2), Nagao (U.S. Patent No. 6466229) and Ramchandran (U.S. Patent No. 5805174), which is recorded on the Examiner's Citation of Pertinent Prior Art below, either separately or in combination, fails to anticipate or render the above underlined limitations obvious.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

***Citation of Pertinent Prior Art***

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure:

Nagao (U.S. Patent No. 6466229) discloses the display list generated and stored as described above is divided into partial areas (called bands hereinbelow) obtained by dividing a page every predetermined width and stored in the display list storage unit on the band unit basis.

Ramchandran (U.S. Patent No. 5805174) discloses A display list for storing objects, along with their characteristics, locations, etc., to be printed on the page is shown having data stored in data blocks 42 of 512 bytes/block for the various zones. The memory required in display list for each zone is generally related to the complexity of the image to be printed in a particular zone. For example, if a zone is blank, then no memory in display list is utilized for that zone. Hence, the number of blocks per zone is variable. It would be understood by those skilled in the art that conventional techniques for conserving display list memory may be utilized, such as by not repeating pattern descriptions (e.g., letters) but simply identifying the locations of previous patterns and issuing a copy command.

Gauthier et al. (US Patent No. 7,532,355 B2) discloses the method of the present invention is accomplished by executing a control task in conjunction with a PDL interpreter program. The control task generates a template display list based upon the PDL commands in the PDL specification. The display list includes a plurality of rendering commands, where each rendering command designates a particular data area or object to be rendered, the graphic states to be applied to the data area and the offset address at which the rendered object.

Schiller et al. (US Patent No. 6,049, 339) discloses a system for blending graphical objects using planar map representations is described. A page description representation of an input document's graphical objects is converted, at least in part, into a planar map representation
